

HTML div, span

Div: Defines a section in a document (block-level)

```
<div style="color:#0000FF">  
  <h3>This is a heading</h3>  
  <p>This is a paragraph.</p>  
</div>
```

The HTML `<div>` element is a block level element that can be used as a container for grouping other HTML elements.

When used together with CSS, the `<div>` element can be used to set style attributes to large blocks of content.

Note: Another common use of the `<div>` element, is for document layout. It replaces the "old way" of defining layout using tables. Using tables is not the correct use of the `<table>` element. The purpose of the `<table>` element is to display tabular data.

By default, browsers always place a line break before and after the `<div>` element. However, this can be changed with CSS

Span: Defines a section in a document (inline)

The HTML `` element is an inline element that can be used as a container for text.

```
<p>I have <span style="color:blue">blue</span> pen.</p>
```
